ABSTRACT

The objective of this study was to evaluate the antibacterial activities of Curculigo orchioides using different solvent extracts. The antibacterial activities were determined against human pathogens viz. Klebsiella pneumoniae, Escherichia coli, Proteus vulgaris, Salmonella typhi and Staphylococcus aureus. The highest value observed from N butyl alcohol extracts of Curculigo orchioides showed antibacterial activity against Klebsiella pneumoniae (inhibition zone 21mm). Moreover, the bioactivity exhibited showed a wide variation among the selected pathogens with the plant extracts were studied. All the tested human pathogens were highly sensitive to ciprofloxacin with the zone of inhibition above 33 mm. Further study is necessary to detect and evaluate the actual constituents responsible for the antibacterial activity of the valuable medicinal plant investigated for its successful utility.

Keywords: Antibacterial activity, Curculigo orchioides, Human pathogens, Bio active compounds, Solvent extracts.

INTRODUCTION

The frequency of life-threatening infections caused by various pathogenic microorganisms has increased world-wide and it has become an important cause of morbidity and mortality (Al-Bari et al., 2006). Due to the indiscriminate application of synthetic antibiotic drugs, many infectious microorganisms have developed resistance against them (Ahmad et al., 1998). Moreover, most of the synthetic drugs are associated with serious side effects (Cunha, 2001) and most of them are relatively expensive (Rat et al., 2004). In this situation, there is an urgent need to discover alternative, more active, broad spectrum and safer antimicrobial agents (Frontling, 1987; Vermani, 2002). Drugs

 Journal Volume 11,Iss 08, 2022

based on plants are thus gaining attraction worldwide (Cragg and Newman, 2009). The bioactive compounds, especially secondary metabolites present in the plants are responsible for the therapeutic nature of plants (Ameenah, 2006; Valsalam et al., 2019).

The plant Curculigo orchioides is a perennial herb having tuberous fleshy roots, leaves and flowers. This plant has tremendous medicinal properties with immune-stimulant, anti-diabetic, aphrodisiac, and anti-oxidant activity (Jena et al., 2021). The present study is a comparative analysis of anti-microbial activity of various extracts of Curculigo orchioides with some known antibiotics against selected human pathogens.

MATERIALS AND METHODS

Collection of medicinal plants

Fresh and healthy Curculigo orchioides plants were collected from various locations of Kanyakumari District. Leaves were extracted and shade dried for ten days and extracts with solvents such as ethanol, n-butyl alcohol, isopropyl alcohol, benzene and acetone were prepared. The extracts obtained from the respective solvents were stored for further use (Bruneton, 1995).

Antimicrobial activity

The selected micro-organisms were cultured on nutrient agar**.** The extracts were tested for their anti-microbial activity using disc diffusion method. Synthetic discs with the antibiotics Chloramphenicol, Tetra-cycline, Ampicillin, Ciprofloxacin, Erythromycin and Neomycin respectively were used for comparison. A total of five human pathogens Staphylococcus aureus, Escherichia coli, Proteus vulgaris, Klebsiella pneumonia and Salmonella typhi were used as test organism. The agar plates were inoculated with test organisms and sterile and dried disc with plant extracts and synthetic discs were placed on the agar surface. The inoculated plates were incubated at 37^0C overnight and the inhibition zone was recorded (Bauer et al., 1966). Sterile plain disc (5mm) without plant extract was used as control. The inhibitory zone around test paper discs indicates the absence of bacterial growth and that was recorded as positive test and the absence of zone as negative test.

RESULTS AND DISCUSSION

Antibiotics are the main therapeutic agents used against bacterial infections. But the higher level of genetic variability among bacteria enables them in developing antibiotic resistance rapidly. Development of novel as well as higher potent antibiotics is necessary all the time (Selvamony et al., 2020). The extracts of Curculigo orchioides with various Solvents showed a wide variation in the anti-bacterial activity among the selected pathogens studied (Table 1; Figure 1). Ethanolic extract of Curculigo orchioides showed maximum antibacterial activity (20mm) against Proteus vulgaris. No activity was found against Salmonella typhi. Acetone extract of Curculigo orchioides showed maximum antibacterial

 Journal Volume 11,Iss 08, 2022

activity (16 mm) against Escherichia coli and Proteus vulgaris. No activity against Staphylococcus aureus is observed. Benzene extract of Curculigo orchioides showed maximum antibacterial activity (18mm) against Staphylococcus aureus and no activity against Klebsiella pneumonia. N-butyl alcoholic extracts of Curculigo orchioides showed maximum antibacterial activity (21mm) against Klebsiella pneumoniae and minimum activity (10mm) against Salmonella typhi. Iso propyl alcoholic extracts of Curculigo orchioides showed maximum antibacterial activity (18mm) against Escherichia coli and had no activity against Proteus vulgaris.

Table 1: Antibacterial activity of different solvent extracts of Curculigo orchioides against selected human pathogens

Human pathogens	Solvents	Zone of inhibitio (mm)
Escherichia coli	Ethanol	9
	Acetone	16
	Benzene	11
	n-Butyl alochol	16
	Isopropyl alcohol	18
Klebsiella pneumoniae	Ethanol	18
	Acetone	9
	Benzene	0
	n-Butyl alochol	21
	Isopropyl alcohol	11
Salmonella typhi	Ethanol	0
	Acetone	12
	Benzene	17
	n-Butyl alochol	10
	Isopropyl alcohol	8
Staphylococcus aureus	Ethanol	6
	Acetone	0
	Benzene	18
	n-Butyl alochol	14
	Isopropyl alcohol	9
Proteus vulgaris	Ethanol	20
	Acetone	16
	Benzene	14

Seven antibiotics Chloramphenicol, Tetracycline, Ampicillin, Ciprofloxacin, Erythromycin, Kanamycin and Neomycin were tested against five bacterial strains Escherichia coli, Klebsiella pneumonia, Salmonella typhi, Staphylococcus aureus and Proteus vulgaris to determine the sensitivity towards antibiotics. Results of the present study reveals that the chloramphenicol inhibited the growth of two bacterial strains such as Staphylococcus aureus and Proteus vulgaris with zone of inhibition above 17mm. Escherichia coli, Klebsiella pneumoniae and Salmonella typhi showed resistance against Chloramphenicol. Tetracycline inhibited the growth of four bacterial strains such as Escherichia coli, Klebsiella pneumoniae, Salmonella typhi and Staphylococcus aureus with the zone of inhibition above (22mm). Proteus vulgaris was not sensitive to Tetracycline. Staphylococcus aereus alone was sensitive to Ampicillin, whereas all the other bacterial strains showed resistance against Ampicillin. Erythromycine showed antibacterial activity against Proteus vulgaris, Staphylococcus aureus, Klebsiella pneumoniae and Salmonella typhi with the zone of inhibition above (11mm). Escherichia coli showed resistance against Erythromycin. Kanamycin inhibited the growth of all the tested bacterial strain with the zone formation above (15mm). Neomycin also showed antibacterial activity against all the tested human pathogens with the zone of inhibition above (20mm). All the tested human pathogens were highly sensitive to ciprofloxacin with the zone of inhibition above (33mm).

the same time Escherichia coli showed resistance towards synthetic antibiotics, Chloramphenicol, Ampicillin and Erythromycin. Klebsiella pneumoneae was insensitive towards benzene extract of Curculigo orchioides, but sensitive towards all other plant extracts. Klebsiella pneumoneae was insensitive towards the antibiotics Chloramphenicol and Ampicillin. Salmonella typhi was found to be sensitive towards all extracts of Curculigo orchioides except ethanol extract. The antibiotics Chloramphenicol and Ampicillin couldn't check the growth of Salmonella typhi. Staphylococcus aureus was sensitive to all antibiotics and various extract of Curculigo orchioides except acetone extract. Proteus vulgaris was insensitive towards Isopropyl alcohol extract and the antibiotics tetracycline and ampicillin. The antimicrobial activity of C. orchioides rhizome may be due to presence of phenolic active compounds in it (Xu et al., 1992). Natarajan et al. (2010) reported the antibacterial activity of methanol, chloroform, acetone and petroleum ether extracts of leaves of Biophytum sensitivum against Bacillus subtillis, Staphylococcus aureus, Klebsiella pneumonia, Salmonella typhi, Proteus vulgaris and Escherichia coli by agar well diffusion method in the range of 7-25 mm.

Table 3 : Comparative analysis of activity of different extracts of Curculigo orchioides and synthetic antibiotics against various human pathogens

The antibiotic compounds are synthetic commercial compounds that inhibit individual micro-organisms. They contain a known concentration of a particular compound. However, the natural extracts could inhibit microbes but not to the level of synthetic commercial compounds because of their crude nature. Yet, the ability of plant extracts to cope up more or less with the activity of standard compounds to decline microbial growth was a valuable outcome of results and this could be correlated with the occurrence of various plant metabolites identified initially in the study.
